## Max Hammond, apply family

20 March, 2023

Write the R code to answer the following questions. You have until the beginning of next class to answer all of the questions below and commit to GitHub.

## Question 1

Use an apply function instead of a for loop to create a vector containing the following elements: "num1", "num2",  $\dots$  "num100"

```
q1 <- lapply(1:100, function(i) paste0("num",i))
unlist(q1)</pre>
```

```
[1] "num1"
                    "num2"
                              "num3"
                                         "num4"
                                                   "num5"
                                                             "num6"
                                                                       "num7"
                                                                                  "num8"
##
         "num9"
                    "num10"
                              "num11"
                                         "num12"
                                                   "num13"
                                                             "num14"
                                                                                  "num16"
##

Use a function in the "apply" family to find the fastest stopping speed for each group of cars, where the cars are grouped by their stopping distance

```
data(cars)
tapply(cars$speed, cars$dist, min)
                                 18

## Question 3

Using an apply function, find the means for each column in the cars dataset.

```
apply(cars, 2, mean)
```

```
## speed dist
## 15.40 42.98
```
